

# Peripheral Devices

Peripheral devices are hardware components connected to a computer system to enhance its functionality. They are not part of the computer's core architecture (CPU and memory) but allow users to input, output, store, and communicate data.

## Types of Peripheral Devices

### 1. Input Devices

Devices used to enter data into a computer. Examples: Keyboard, Mouse, Scanner, Microphone, Webcam, Barcode Reader.

### 2. Output Devices

Devices that display or produce results from the computer. Examples: Monitor, Printer, Speakers, Projector, Plotter.

### 3. Storage Devices

Devices used to store data permanently or temporarily. Examples: Hard Disk Drive (HDD), Solid State Drive (SSD), USB Flash Drive, Memory Card, External Hard Disk.

### 4. Communication Devices

Devices that help computers communicate over networks. Examples: Modem, Network Interface Card (NIC), Wi-Fi Adapter, Bluetooth Adapter.

# **Advantages of Peripheral Devices**

- Improve productivity and efficiency.
- Enable user interaction with computers.
- Facilitate data storage and backup.
- Support multimedia and communication.
- Expand the capabilities of computer systems.

## **Conclusion**

Peripheral devices play a crucial role in modern computing by providing input, output, storage, and communication functions. They help users interact with computers effectively and enhance the overall computing experience.
